Choose Your Combination of GO Milling and GO Turning Levels

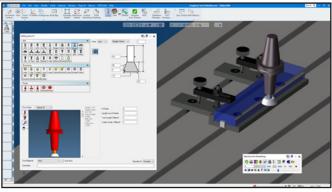

GO Milling

GibbsCAM GO Milling provides powerful yet easy-touse programming capabilities for 2-axis through simple 3-axis wireframe machining. GibbsCAM creates CAD for manufacturing to accelerate the programming process.

Contouring, pocketing, thread and face milling, spiral creation, drilling, tapping, and boring are standard CNC with GibbsCAM GO Milling. Walls can be tapered or straight, or can even follow a swept shape. Finish your parts with automated face milling from spiral, zig-zag, back-forth, and one direction.

Graphical tool definition displays tool types and key dimensions

Freeform Geometry Creation

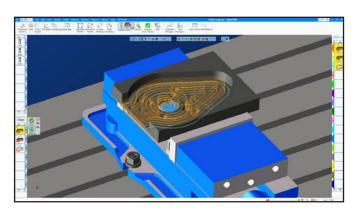

Whether you start with imported geometry or need to create your own geometry, the GibbsCAM GO Milling freeform geometry capabilities provide a powerful means to create and edit geometry for machining. The GibbsCAM graphical user interface infers what operations you want to perform based on the selected elements, which dramatically streamlines interactions with the system. Chaining is not required so there is no need to stop the workflow continually to trim and connect geometry.

Graphical Tool Definition

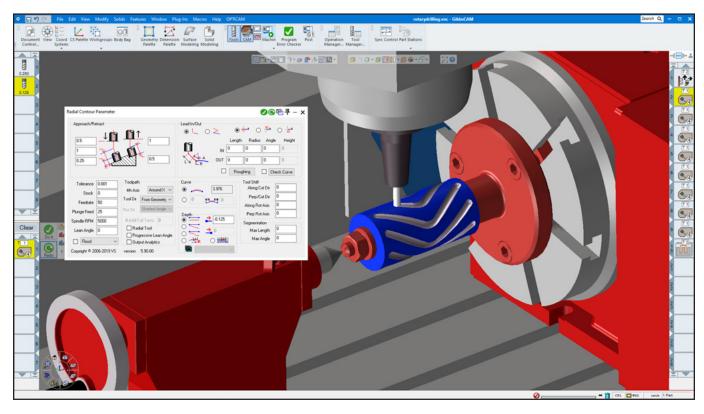

The GibbsCAM GO Milling graphical user interface displays key dimensions to create error-free tools easily. It supports a wide variety of predefined tool types and user-defined form tools.

Multi-Process Programming

Select geometry once and apply multiple machining operations like a series of rough, semi-rough, finish passes to it all at once. The resulting processes are associated with each other and the original geometry, so updates are accommodated easily.

Multi-process programming

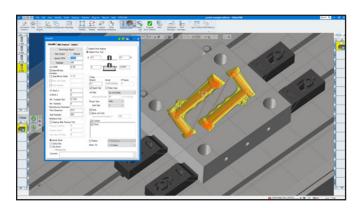

Polar and cylindrical milling

Polar and Cylindrical Milling

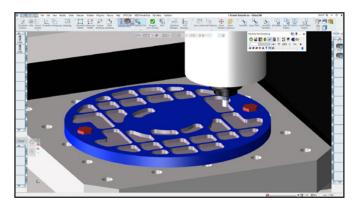

The Polar and Cylindrical Milling option drives one rotary and two linear axes to achieve a 3-axis toolpath. It extends the standard 3-axis milling functions for use on machines with a rotary axis to enable wrapped geometry, cylindrical and polar rotary milling, and rotary repeats.

Advanced Pocketing with VoluMill™

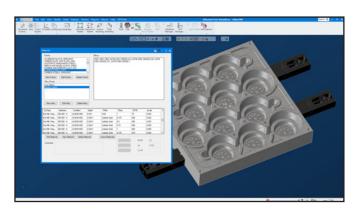

The GibbsCAM GO Milling advanced pocketing routines support machining open-sided pockets and pilot and/or auto pocket corner drill pockets with unlimited islands or bosses. You can specify whether to machine pockets breadth or depth first. It supports pocketing machining strategies including Auto Plunge, User Plunge, Ramp, Periphery Ramp, and Helix. VoluMill™ Wireframe adds powerful high speed roughing functionality and controlled material removal.

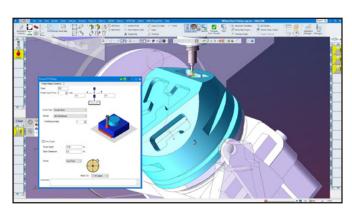

Advanced pocketing routines

Toolpath visualization and verification

CutDATA recommends feeds and speeds

Probing (optional add-on)

Hole-Making Sub-Routines

GibbsCAM GO Milling supports a wide range of boring (bore, fine bore, backbore), drilling, and tapping subroutines to optimize efficient hole-making operations. You can also program thread mills, and support for rotary and linear broaching is built in.

Toolpath Visualization and Verification

3D rendering of the toolpath, showing cutting action and an accurate preview of machining and surface finish.

CutDATA™

Over 71,000 machining recommendations for feeds and speeds for use with Material Database. CutDATA is user-configurable to create a speeds and feeds database suited to how you machine your parts.

Advanced Coordinate Systems

GibbsCAM GO Milling offers multiple coordinate systems for modeling, and 4 and 5-axis rotary positioning.

Utility Operations (Non-cutting Motions)

Park non-standard axes [e.g. a quill or W-axis], or program machine attachments like a robot, pallet changer, steady rest, or tailstock.

Probing (Optional Add-on)

GibbsCAM Probing lets you program setup and inprocess inspection for a wide variety of machines, and supports probing technologies from all major inspection vendors. Users are able to specify a measurement cycle as G-Code to be inserted into the program at selected probing points. Probing automatically handles the positioning and orientation of the probe, including safe traversals between probe points.

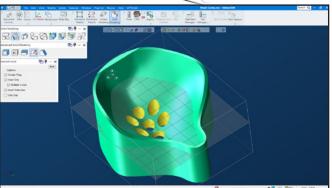

GO Solid Milling

GibbsCAM's cost-effective suite of solids-based options provide a more complete representation and enable more intuitive modeling and advanced machining capabilities for today's solid and surface models.

Create ultra-efficient part programs with gouge-free toolpaths using GibbsCAM's integrated advanced machining capabilities. Programming efficiency is significantly enhanced with highly automated multi-tool, multi-surface roughing and finishing, and "material only" machining methods.

Powerful solid modeling

We have wreather him to be a considerable of the considerable of t

Importing and repairing models

Powerful Solid Modeling

Whether you import solid models from a CAD system, create your own from scratch, or modify an imported solid to create a manufacturable version, GibbsCAM GO Solid Milling provides a full range of solid modeling functionality with advanced functionality like history trees to support you. And its industry-leading ease-of-use makes working with solids straightforward and easy-to-understand. With its powerful solid modeling tools, you can take full advantage of solid modeling technology.

Importing and Repairing Surface Models

Even with the transition to solids, CAD systems still generate surface models that must be imported and machined. With GibbsCAM GO Solid Milling, you can read in surface models and then repair any problems that you encounter with a broad range of surface modeling tools. And you can create your own surfaces for machining. If you still work with surface models, GibbsCAM GO Solid Milling can still cut your jobs and provide a great migration path to solids-based machining.

CAD Import

Import Parasolids, ACIS/SAT, STEP® and VDA models, and also directly from well-known CAD systems such as Solid Edge®, SOLIDWORKS®, and Inventor®. Options are available to extend CAD Interoperability for PTC, CATIA and NX.

Automatic Solidification

With GibbsCAM GO Solid Milling, you do not have to start with solid models to take advantage of solids-based machining. Automatically stitch surface models together, whether imported or created, to create solid models that can then be further modified with the GibbsCAM solid modeling tools or machined directly.

Solids Positioning Tools

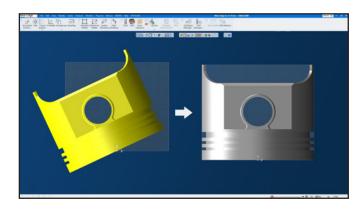

Powerful positioning tools allow you to position and orient solids easily and precisely, and avoid the hassle of calculating transformation to orient them correctly. Not only are these tools extremely useful when modeling a single part made up of multiple pieces, but they can streamline setting up part models in fixturing significantly.

Directly Machining 2.5D Solids

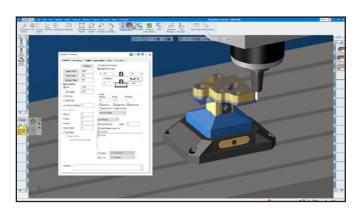

Not only do solid models provide considerable advantages during design, but they also offer many advantages during machining. GibbsCAM allows users to machine solids directly and take advantage of the additional information available in solids, which results in improved performance, reliability, and efficiency.

Profiler

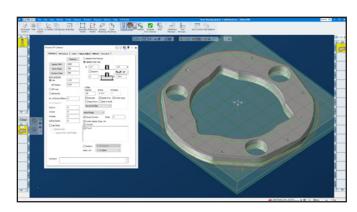

Identifying the manufacturable features in a part is a common starting point for a program. The Profiler interactively defines features like bosses, slots, and pockets. Unlike automatic feature recognition, the Profiler gives you complete control over the geometric elements that are included in a feature. The Profiler can also derive geometry interactively with feature-based machining.

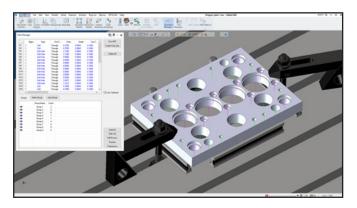

Align edge to coordinate system for easy orientation

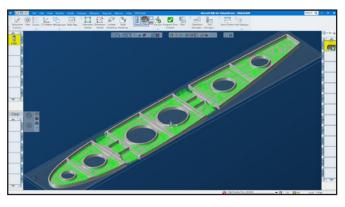

Directly machining 2.5D solids

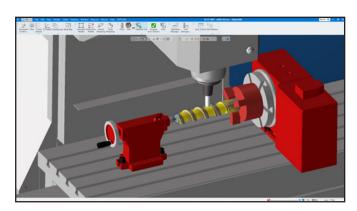

Interactive Profiler controls geometric elements

Automatic feature recognition / hole manager

VoluMill adds powerful high-speed material removal

Radial milling

Automatic Feature Recognition

Hole-making represents a significant amount of programming and machining time. GibbsCAM GO Solid Milling provides an automatic feature recognition (AFR) capability that identifies holes along with their position and orientation and also determines various hole aspects (chamfer, counter-sink/bore, bottom condition) based on the hole's geometry.

Hole Manager

The Hole Manager streamlines the time-intensive process of hole-making by identifying hole parameters and grouping them for processing. The Hole AFR is integrated with the Hole Manager so that you can identify hole features to be loaded automatically. The Hole Wizard is similarly integrated so that hole information is passed directly for automatic tooling and toolpath generation.

Machine Simulation

Identify any programming errors before they cause costly mistakes on the shop floor. Uses a model of your machine tool to simulate machine tool motion and verify your setup.

VoluMill™ Solids

Adds powerful high speed roughing functionality and controlled material removal rate for machining solid models. Automatically avoid tool and holder collisions in deep pockets. Wall cleanup functionality leaves minimal material on tapered walls without wasting machining time.

Radial Milling

Simultaneously drives one rotary axis (A, B, or C) with X, Y, and/or Z for true 4-axis analytic cutting. Supports Y-axis off-center milling for radial prismatic parts defined by solid models or 3D geometry.

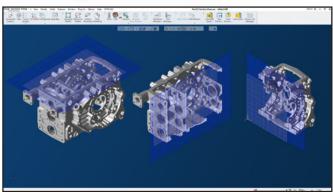

GO Pro Milling

GibbsCAM GO Pro Milling is designed to handle the most exacting of modeling and machining demands for complex mold, tool, and die creation. GibbsCAM GO Pro Milling includes high-level modeling and advanced functionality for machining surfaces and solids.

Tackle complex functions easily with the intuitive GibbsCAM user interface. Use the advanced 3D high-speed machining in GibbsCAM GO Pro Milling to create a toolpath that is ideal for hard metal cutting and for smooth surface finishes.

Section view reveals internal X, Y, Z views on cavity

Extract/Heal capability for core and electrode creation

Extended Surface Modeling Capabilities

Though parts files are often provided in solid model format, surface modeling is a key capability for programmers. GibbsCAM GO Pro Milling provides extended surface modeling capabilities to handle surface creation or modification. And its powerful surface modeling functionality is easy to use.

Automatic Parting Line Generation

You need to separate mold halves at the extents of the part to ensure that the part can be removed readily. Manually determining where the parting line should be is a very tedious process. With GibbsCAM GO Pro Milling, you can generate the correct parting line automatically and then use it to divide the mold halves easily.

Extract/Heal Features (for Core/Cavity or Electrodes)

Often parts include minor features that get in the way when generating toolpaths. You can suppress these features with the GibbsCAM GO Pro Milling extract/heal feature capability, which removes the feature's geometry and heals the surrounding area. You can use the solid, which is generated from the suppressed feature, to create cores or electrodes.

Multiple Offsets

You must consider different types of surfaces when machining: the surface that is being machined, the part surfaces not being machined, and any surfaces associated with fixtures. With GibbsCAM GO Pro Milling, you can specify the offset, or how closely the tool comes, for each of these surface types. So, you're in complete control when generating toolpaths.

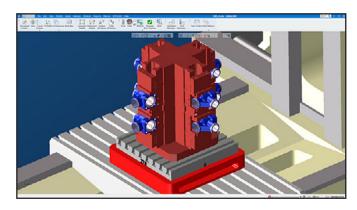

3D Projection Machining

Sometimes you want to have direct control of the toolpath over multiple surfaces. You generate the toolpath you want and then you project it onto the surfaces to be machined. The source for the toolpath geometry can be just about anything, including text. GibbsCAM GO Pro Milling provides a powerful capability that allows you to project geometry onto surfaces to generate final toolpath geometry.

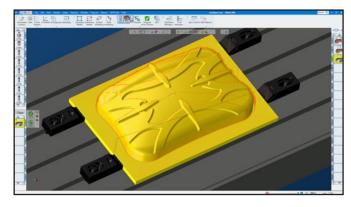

Advanced 3D with High-Speed Machining

Advanced 3D with High-Speed Machining (HSM) adds the next level of 3D surface and solid body machining:

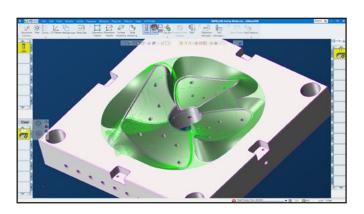

- New types of finishing processes
- Support for 3D material only toolpaths
- Enhanced entry/exit control
- Direct machining for faceted bodies such as imported STL files
- Automatic core/cavity detection for inside-out or outside-in determination
- Operation splitting for tool wear and for optimal length out of the holder
- Automatic filleting of a surface to avoid sharp concave corners
- Support for batch toolpath generation

Tombstone (optional add-on)

GO Mill/Turn

By combining GO Milling and GO Turning, you gain mill/turn capability, with support for X, Y, Z linear axes plus a C or B rotary axis. Fast parametric radial duplication of repetitive operations and of features such as holes, slots, pockets and flats makes quick work of complex mill-turn parts. GO Mill/Turn also supports simultaneous turning on the B-axis.

GO Mill/Turn

Choose Your Combination of GO Milling and GO Turning Levels

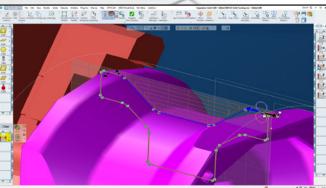

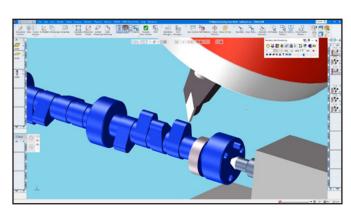

GO Turning

GibbsCAM GO Turning supports 2-axis fully-functional, wireframe machining. Its advanced functionalities, such as maintaining an awareness of the current stock condition, make programming lathes not only easy but also extremely efficient. GibbsCAM GO Turning provides easy-to-use, powerful capability for programming your turning centers.

Start/end point control

Advanced turning kinematics

Full 2-Axis Programming

GibbsCAM GO Turning provides a full range of functionality for defining processes for efficiently machining 2-axis parts from wireframe geometry. It has full functionality for contouring, automatic roughing, multiple hills and valleys, plunge roughing, threading, repetitive shape roughing, drilling, tapping and boring.

Start/End Point Control

With GibbsCAM GO Turning you have complete control over where you initially position the tool to start machining to where you finish machining. Approach extensions are automatically generated if the tool is started off the machined profile.

Graphical Tool Definition

GibbsCAM GO Turning's graphical user interface to define tools shows the user key dimensions to allow easy and error free tooling creation. The system supports wide variety of predefined tool types as well as user-defined form tools.

Advanced Turning Kinematics

Built-in support for interpolated & eccentric turning. Machine high-quality off-center turned features on large or awkward parts at any orientation.

VoluTurn™

Adds powerful high-speed turning solution for GibbsCAM GO Turning. Ideal for reducing tool wear with round inserts in hard materials and superalloys.

Advanced Roughing Routines

GibbsCAM GO Turning provides a full range of roughing routines such as turn roughing cycles for plunge roughing with automatic shoulder stroking, and pattern shift roughing with constant path and constant step over choices.

Subspindles and Auxiliary Devices

Integrated support for machining on twin-spindle lathes and other simple multi-tasking machines, including material-aware part transfers and shifts. It also programs auxiliary devices, such as tailstocks, steady rests, bar feeders, and part catchers. Advanced MTM options are available for machines with multiple flows or channels.

Tool Approach Control

Define toolpaths so the tool cuts in both forward and reverse directions or in one direction only. No tool dragging automatically calculates optimal cutting toolpaths, so the tool is cuts in a forward insert direction.

Canned Cycle Support

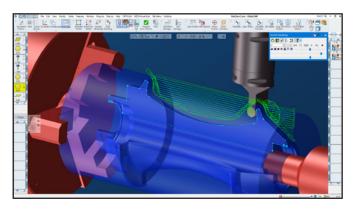

Supports a wide range of canned cycles, such as face, OD/ ID and casting canned cycles for roughing and finishing operations as well as most drill-type cycles.

Material Awareness

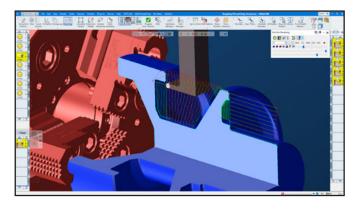

GO Turning maintains an awareness of remaining stock and automatically calculates entry/exits, toolpath moves, and rapid movements to avoid material.

Profile Boring and Facing

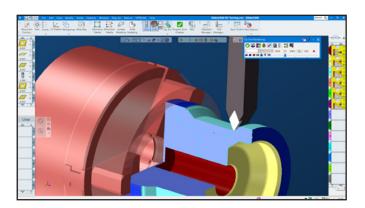

Program a U-axis head on a milling or mill/turn center to machine variable-profile bores, bosses, and faces, using the same easy-to-learn techniques for a lathe.

VoluTurn

Advanced roughing routines

Canned cycle support

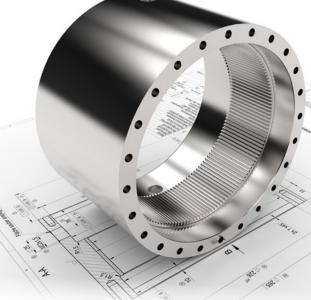

GO Solid Turning

GibbsCAM's cost-effective suite of solids-based options provide a more complete representation and enable more intuitive modeling and advanced machining capabilities for today's solid and surface models.

Create ultra-efficient part programs with gouge-free toolpaths using GibbsCAM's integrated advanced machining capabilities. Programming efficiency is significantly enhanced with highly automated multi-tool machining methods.

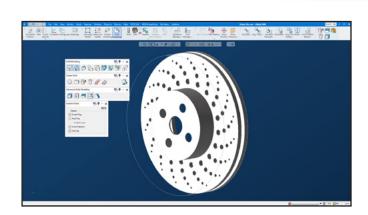

Powerful Solid Modeling

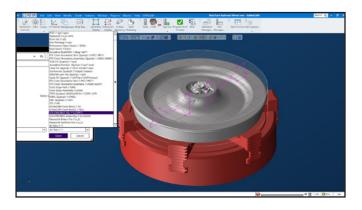

Whether you import solid models from a CAD system, create your own from scratch, or modify an imported solid to create a manufacturable version, GibbsCAM GO Solid Turning provides a full range of solid modeling functionality with advanced functionality like history trees to support you. And its industry-leading ease-of-use makes working with solids straightforward and easy-to-understand. With its powerful solid modeling tools, you can take full advantage of solid modeling technology.

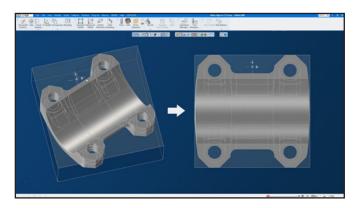

Even with the transition to solids, CAD systems still generate surface models that must be imported and machined. With GibbsCAM GO Solid Turning, you can read in surface models and then repair any problems that you encounter with a broad range of surface modeling tools. And you can create your own surfaces for machining. If you still work with surface models, GibbsCAM GO Solid Turning can still cut your jobs and provide a great migration path to solids-based machining.
